measuring a voltage induced by the electric current, and

adapting at least one process control parameter in response to the measured voltage,
characterized by:

5 determining information relating to the spectral composition of the measured voltage
within a predetermined measuring period during the process of electrochemically machining, and
adapting the at least one process control parameter in accordance with said information,

10 wherein said information comprises a running average of amplitudes representative of a
range of frequency components greater than a predetermined frequency across a predetermined
time interval and the adapting of the at least one process control parameter is in case of response to
a substantially substantial change of the amplitudes within the predetermined measuring period.

Claim 10 (canceled)

15 Claim 11 (currently amended): A method according to claim 1, of controlling a process of
electrochemically machining an electrically conductive workpiece, wherein the process comprises
applying an electric current between the workpiece and an electrically conductive electrode while
electrolyte is supplied between the workpiece and the electrode, and the method of controlling
comprises:

20 measuring a voltage induced by the electric current, and
adapting at least one process control parameter in response to the measured voltage,
characterized by:

determining information relating to the spectral composition of the measured voltage
within a predetermined measuring period during the process of electrochemically machining, said
predetermined measuring period, and
25 adapting the at least one process control parameter in accordance with said information,
wherein the at least one process control parameter involves changing applying the electric current
continuously to applying the electric current intermittently.

30 Claim 12 (currently amended): A method according to claim 11, wherein
during applying the electric current continuously, the electrode and the workpiece are
moved relatively to each other with a substantially constant speed and

during applying the electric current intermittently, the electrode and workpiece are moved relatively to each other in an oscillatory manner or in a repeated manner superposed on a linear movement with applying the current at or near the instant of smallest mutual distance induced by the oscillatory or repeated ~~distance between~~ movement between the workpiece and the electrode.

Claim 13 (original): A method according to claim 12, wherein a sequence of intermittently applied electric current pulses is applied when the relative distance between the workpiece and the electrode is small during the relatively oscillatory or repeated movement.

Claim 14 (original): A method according to claim 1, wherein the applying of electric current comprises applying electric current pulses of a normal polarity intermittently in pulse like periods, the at least one process control parameter controls applying additionally one or more electric current pulses of an opposite polarity.

Claim 15 (original): A method ~~according to claim 1~~, of controlling a process of electrochemically machining an electrically conductive workpiece, wherein the process comprises applying an electric current between the workpiece and an electrically conductive electrode while electrolyte is supplied between the workpiece and the electrode, and the method of controlling comprises:

measuring a voltage induced by the electric current, and
adapting at least one process control parameter in response to the measured voltage, characterized by:

determining information relating to the spectral composition of the measured voltage within a predetermined measuring period during the process of electrochemically machining, and

adapting the at least one process control parameter in accordance with said information,

wherein the applying of electric current comprises applying electric current pulses of a normal polarity intermittently in pulse like periods, the at least one process control parameter controls applying additionally electric current passivation pulses of the same polarity but with an voltage having an amplitude which is inadequate to dissolve the workpiece and a passivation film on the workpiece.

Claim 16 (previously presented): A method according to claim 1, wherein the at least one process control parameter controls the application of an electrode cleaning electric current intermittently in one or more pulse like periods with an opposite polarity causing the electrode to be cleaned of deposited waste.

5

Claim 17 (previously presented): A method according to claim 16, wherein the electrode and workpiece are moved relatively to each other in a repeated movement, the applying of electric current comprising applying electric pulses intermittently when the distance between the workpiece and the electrode is relatively small,

10

the corresponding position of electrode and workpiece being determined by first bringing the workpiece and the electrode in contact with each other and applying a measurement current instead of a machining current to determine a contact, and

the at least one process control parameter controls the applying of one or more electrode cleaning pulses prior to bringing the workpiece and electrode in contact.

15

Claim 18 (currently amended): A method of controlling a process of electrochemically machining an electrically conductive workpiece, wherein the process comprises applying an electric current between the workpiece and an electrically conductive electrode while electrolyte is supplied between the workpiece and the electrode, and the method of controlling comprises:

20

measuring a voltage induced by the electric current and

adapting at least one process control parameter in response to the measured voltage, characterized by

determining information relating to the spectral composition of the measured voltage within a predetermined measuring period during the process of electrochemically machining, and

25

adapting the at least one process control parameter in accordance with said information, wherein the electrode and workpiece are moved relatively to each other in a repeated movement,

the application of electric current comprises applying electric pulses intermittently in pulse like periods when the distance between the workpiece and the electrode is relatively small,

30

and

the at least one process control parameter ~~controls changing the duration~~ is a timing parameter of the pulse like period.

Claim 19 (currently amended): A method according to claim 18, wherein the timing parameter is the duration of the pulse like period, and said duration is reduced to a value smaller than a seeding time required for formation of gas bubbles in the electrolyte.

5

Claim 20 (original): A method according to claim 19, wherein the pulse period is reduced to a value between 10 to 100 microseconds.

Claim 21 (original): A method according to claim 20, wherein the corresponding pulse forefront
10 has a value between 100 and 1000 nanoseconds.

Claim 22 (original): A method according to claim 19, wherein sequences of intermittently applied electric current pulses are being applied, the pauses between the pulses in a sequence having a value larger than a escape time required for escaping gas bubbles that has been formed in the
15 electrolyte.

Claim 23 (original): A method according to claim 22, with a ratio of pause/pulse duration between 2 and 10.

20 Claim 24 (original): A method according to claim 9, wherein the at least one process control parameter controls a fast interrupt of the applied electric current.

Claim 25 (currently amended): A method according to claim ~~4~~ 18, wherein the electrode and workpiece are moved relatively to each other in an oscillatory movement, ~~the electric current being supplied intermittently in pulse like periods when the distance between the workpiece and the electrode is relatively small,~~ the ~~at least one process control~~ timing parameter comprises the relative phase shift between the oscillatory movement and the start of applying the electric current in each oscillatory movement.

30 Claim 26 (currently amended): A method according to claim 1, wherein the electrode and ~~workpiece~~ workpiece are moved relatively to each other in an oscillatory movement, the electric current being supplied intermittently in pulse like periods when the distance between the workpiece

and the electrode is relatively small, the at least one process control parameter comprises an electrolyte pressure.

Claim 27 (original): A method according to claim 1, wherein the electrode and workpiece are moved relatively to each other in an oscillatory movement, the electric current being supplied intermittently in pulse like periods when the distance between the workpiece and the electrode is relatively small, the at least one process control parameter comprises the relative machining speed the workpiece and electrode are being moved relatively to each other.

Claim 28 (original): A method according to claim 1, wherein the process of electrochemically machining comprises applying the electric current in pulse like periods, wherein the predetermined measuring period substantially corresponds to the duration of a pulse.

Claim 29 (currently amended): A method according to claim 1, of controlling a process of electrochemically machining an electrically conductive workpiece, wherein the process comprises applying an electric current between the workpiece and an electrically conductive electrode while electrolyte is supplied between the workpiece and the electrode, and the method of controlling comprises:

measuring a voltage induced by the electric current, and
adapting at least one process control parameter in response to the measured voltage,
characterized by:
applying the electric current substantially continuously during a first time duration,
determining information relating to the spectral composition of the measured voltage
within a predetermined measuring period during the process of electrochemically machining, and
adapting the at least one process control parameter in accordance with said information,

wherein the process of electrochemically machining comprises applying the electric current substantially continuously during a first time duration, wherein the predetermined measuring period is a fraction of said first time duration, such that variations in process conditions may be measured within the measuring period.

Claims 30-38 (canceled)

Claim 39 (original): An arrangement for electrochemically machining an electrically conductive workpiece by applying an electric current between a workpiece and an electrically conductive electrode while electrolyte is supplied between the workpiece and the electrode, the arrangement comprises:

- 5 an electrically conductive electrode (3);
 means for positioning (4,5) the electrode and the workpiece (1) in a spatial relationship
so as to maintain a gap between the electrode (3) and the workpiece (1);
 means for supplying (7) the electrolyte into the gap;
 an electric power supply source (11), which is electrically connectable to the electrode
10 (3) and the workpiece (1) to apply an electric current between the workpiece (1) and the electrode
(3),
 characterized in that, the arrangement further comprises
 voltage measurement means (17,22) electrically connected with the electrode (3) and the
workpiece (1) or with an impedance circuitry in a power supply line between the power supply
15 source (11) and the workpiece (1) or the electrode (3);
 process adjusting means (16,24,27,30) for adjusting at least one process control
parameter of the electrochemically machining process;
 controlling means (12) connected with the voltage measurement means (17,22) and the
process adjusting means (16,24,27,30)
20 the controlling means (12) being provided with analyzing means (48) for determining
information (Ck, Ac) relating to the spectral composition of a measured voltage (Um) within a
predetermined period (Tm, Tm') during the process of electrochemically machining and
 the controlling means (12) being adapted to adjust the at least one process control
parameter signal (Pi, S1, S2, SEL1, SEL2, CI1, CU1, ..) in accordance with said spectral
25 information.

Claim 40 (original): Arrangement according to claim 39, characterized in that,
 the analyzing means (48) are adapted to generate at least one spectral signal
representative of an amplitude of at least one frequency component or at least one range of
30 frequency components of the measured voltage.

Claim 41 (original): Arrangement according to claim 40, characterized in that,

the analyzing means (48) comprises harmonic detecting means (53) for generating a spectral signal (C_k) representative of at least an harmonic frequency of the waveform constituted by the measured voltage (U_m) within the predetermined measuring period (T_m).

5 Claim 42 (original): Arrangement according to claim 41, characterized in that,
the analyzing means (48) comprises waveform expanding means (53) expanding the waveform within the predetermined measuring period (T_m , T_m') in a Fourier series and for generating spectral signals representative of the amplitudes of Fourier coefficients C_k of the Fourier series.

10

Claim 43 (original): Arrangement according to claim 42, characterized in that,
the waveform expanding means (53) comprises sign determining means to determine the sign of the spectral signals representing a first number of harmonics of said Fourier series,
the controlling means (12) comprises assigning means (54) to generate a specific process
15 condition signal in case of a specific combination of signs of the spectral signals C_k representing the first number of harmonics are being supplied to the controlling means (49)

Claim 44 (original): Arrangement according to claim 43, characterized in that,
the assigning means (54) are adapted to generate a first process condition signal (T)
20 indicative of a relatively low current density in case if the spectral signals indicate the absence of a first number of Fourier coefficients C_k .

Claim 45 (original): Arrangement according to claim 43, characterized in that,
the assigning means (54) are adapted to generate a second process condition signal (T)
25 indicative of the presence of gas-filled cavities in the electrolyte in case if the spectral signals indicate a second number of consecutive Fourier coefficients C_k with mutually alternating signs.

Claim 46 (original): Arrangement according to claim 43, characterized in that,
the assigning means (54) are adapted to generate a third process condition signal (T)
30 indicative of the presence of a relatively high current density in case of a third number of consecutive Fourier coefficients C_k with mutually equal signs.

Claim 47 (original): Arrangement according to claim 40, characterized in that,

the analyzing means (48) comprises

high pass filtering means (55) for generating spectral signals representative of a range of frequency components greater than a predetermined frequency and

5 spectral signal change detecting means (59) for detecting a rapid change of the generated spectral signals within the predetermined measuring interval (T_m) and supplying a corresponding spectral signal change signal (A_c) to the controlling means,

the controlling means (12) being adapted to adjust the at least one process control parameter signal in case of the spectral signal change signal (A_c) being supplied.

10

Claim 48 (original): Arrangement according to claim 47, characterized in that,

the analyzing means (48) comprise averaging means (58) for averaging the amplitudes of the spectral signals generated across a predetermined time interval (T_m).

15 Claim 49 (original): Arrangement according to claim 39, characterized in that,

the electric power supply source (11) comprises a constant current or a constant voltage source (15,23) for applying the electric current continuously,

a pulsed current or pulsed voltage source (26,29) for applying the electric current intermittently and

20 switching means (19,25,28,31) to switch between the respective sources.

Claim 50 (original): Arrangement according to claim 49, characterized in that,

the means for positioning comprises :

25 first positioning means (4) for moving the electrode (3) and the workpiece (1) relatively to each other with a substantially constant speed and

second positioning means (5) for moving the electrode (3) and the workpiece (1) relatively to each other in oscillatory or repeated manner.

30 Claim 51 (original): Arrangement according to claim 50, characterized in that, the pulsed current source (26,29) is adapted to generate a sequence of intermittently applied pulses when the relative distance between the workpiece (1) and the electrode (3) is small during the relatively oscillatory or repeated movement.

Claim 52 (original): Arrangement according to claim 39, wherein the pulsed current source (26,29) is adapted to apply electric current pulses of a normal polarity intermittently in pulse like periods, characterized in that,

5 the pulsed current source (26,29) is further adapted to apply additionally one or more current pulses of an opposite polarity in response to at least one process control parameter signal (SEL1, SEL2, CII, CU1...)

Claim 53 (original): Arrangement according to claim 39, wherein the pulsed current source (26,29) is adapted to apply electric current pulses of a normal polarity intermittently in pulse like periods, characterized in that,

10 the pulsed current source (26,29) is further adapted to apply additionally electric passivation pulses of the same polarity but with an voltage having an amplitude which is inadequate to dissolve the workpiece (1) and a passivation film on the workpiece (1) in response to at least one process control parameter signal (SEL1, SEL2, CII, CU1...).

Claim 54 (original): Arrangement according to claim 39, wherein the pulsed current source (26,29) is adapted to apply an electrode cleaning electric current intermittently in one or more pulse like periods with an opposite polarity causing the electrode (3) being cleaned of deposited waste in response to at least one process control parameter signal (SEL1, SEL2, CII, CU1...).

Claim 55 (original): Arrangement according to claim 54, wherein the positioning means (4,5) are adapted to move the electrode (3) and the workpiece (1) to each other in a repeated movement, the pulsed current source (26,29) is adapted to apply electric current pulses intermittently when the distance between the workpiece (1) and the electrode (3) is relatively small, the control unit (12) is adapted to determine the corresponding position of electrode (3) and workpiece (1) by first bringing the workpiece (1) and the electrode (3) in connection with each other and applying a measurement current in stead of a machining current to determine a connection, characterized in that, the pulsed current source (26,29) is adapted to apply one or more electrode cleaning pulses prior to bringing the workpiece (1) and electrode (3) in connection.

Claim 56 (original): Arrangement according to claim 39, wherein the positioning means (4,5) are adapted to move the electrode (3) and the workpiece(1) relatively to each other in a repeated movement, the pulsed current source (26,29) is adapted to apply electric pulses intermittently in pulse like periods when the distance between the workpiece (1) and the electrode (3) is relatively small, characterized in that, the pulsed current source (26,29) is adapted to change the duration of the pulse like period in response to the at least one process control parameter signal.

Claim 57 (original): Arrangement according to claim 56, wherein the pulsed current source (26,29) is adapted to apply electric pulses with a duration of the pulse like period reduced to a value smaller than a seeding time required for formation of gas bubbles in the electrolyte, such as for instance the formation of hydrogen gas.

Claim 58 (original): Arrangement according to claim 57, wherein the pulse period is reduced to a value between 10 to 100 microseconds.

Claim 59 (original): Arrangement according to claim 58, wherein the corresponding pulse ,forefront period has a value between 100 and 1000 nanoseconds.

Claim 60 (original): Arrangement according to claim 57, wherein the pulsed current source (26,29) is adapted to generate sequences of intermittently applied electric current pulses, the pauses between the pulses in a sequence having a value larger than a escape time required for escaping gas bubbles that has been formed in the electrolyte.

Claim 61 (original): Arrangement according to claim 60, with a ratio of pause/pulse duration between 2 and 10.

Claim 62 (currently amended): Arrangement according to claim ~~33~~ 39, wherein the electric power supply source (11) is adapted to interrupt the supply of electric current fast in response to the at least one process control parameter signal.

Claim 63 (original): Arrangement according to claim 39, wherein the positioning means (4,5) are adapted to move the electrode (3) and the workpiece(1) relatively to each other in an oscillatory

movement, the pulsed current source (26,29) is adapted to apply electric pulses intermittently in pulse like periods when the distance between the workpiece (1) and the electrode (3) is relatively small, characterized in that, the controlling means (12) are adapted to change the relative phase shift (ϕ) between the oscillatory movement and the start of applying the electric current each
5 oscillatory movement in response to the at least one process control parameter signal.

Claim 64 (original): Arrangement according to claim 39, wherein the positioning means (4,5) are adapted to move the electrode (3) and the workpiece(1) relatively to each other in an oscillatory movement, the pulsed current source (26,29) is adapted to apply electric pulses intermittently in
10 pulse like periods when the distance between the workpiece (1) and the electrode (3) is relatively small, characterized in that, the controlling means (12) are adapted to change the electrolyte pressure (P_{el}) in response to the at least one process control parameter signal.

Claim 65 (original): Arrangement according to claim 39, wherein the positioning means (4,5) are
15 adapted to move the electrode (3) and the workpiece(1) relatively to each other in an oscillatory movement, the pulsed current source (26,29) is adapted to apply electric pulses intermittently in pulse like periods when the distance between the workpiece (1) and the electrode (3) is relatively small, characterized in that, the controlling means (12) are adapted to change the relative machining speed the workpiece (1) and the electrode (3) are moved to each other in response to the at least one
20 process control parameter signal.

Claim 66 (original): Arrangement according to claim 39, wherein the electric power supply source (11) is adapted to apply electric current pulses in pulse like periods, characterized in that, the
25 predetermined measurement period (T_m , T_m') substantially corresponds to the duration of a pulse.

Claim 67 (original): Arrangement according to claim 39, wherein the electric power source (11) is adapted to apply the electric current substantially continuously during a first time duration, characterized in that, the predetermined measurement period (T_m , T_m') is a fraction of said first time duration, such that variation in process conditions may be measured within the measuring
30 period (T_m , T_m').

Claims 68-76 (canceled)

Claim 77 (original): A method of electrochemically machining an electrically conductive workpiece by applying an electric current between the workpiece and an electrically conductive electrode while electrolyte is supplied between the workpiece and the electrode, the method

5 comprising:

a material removing step wherein the electric current is supplied continuously while the workpiece and the electrode are moved relatively to each other with a substantially constant speed,

a workpiece shaping step wherein the electric current is supplied intermittently in pulse like periods while the workpiece and the electrode are moved relatively to each other in a
10 oscillatory or repeated movement, the electric current being supplied when the distance between the workpiece and the electrode is relatively small, the method further comprising :

measuring a voltage induced by the electric current,

determining information relating to the spectral composition of the measured voltage within a predetermined measuring period during the process of electrochemically machining and

15 adapting at least one process control parameter in accordance with said information.

Claim 78 (new): A method as claimed in claim 1, wherein said duration is selected such that transient periods during the application of the electric current are omitted
